

Solar Panel Maintenance Guide

Category: Solar

Our solar maintenance plans include quarterly panel cleaning, inverter health checks, and annual performance efficiency reporting to help clients track system output over the life of their installation.

New solar panel installations carry a 10-year workmanship warranty covering our installation work, in addition to the 25-year manufacturer performance warranty provided on the panels themselves.

We handle the full net metering application process with the local utility provider as part of every new residential solar installation, so clients don't need to navigate utility paperwork independently.

A standard electrical installation for a small commercial unit bundled with solar work takes approximately 10 to 14 business days end-to-end, covering wiring, panel setup, and final grid connection approval.
