

Access Control & Security Systems Brochure

Category: AccessControl

We install fingerprint and facial recognition biometric access control systems for offices, data centers, and secured facility entrances requiring strict identity verification before entry.

A standard access card system installation includes card reader hardware, access control software setup, and up to 50 pre-programmed access cards for initial staff onboarding.

Access control installation for a single-entrance office setup typically takes 2 to 3 business days, including hardware mounting, software configuration, and a final access test with facility staff before handover.

Access control systems can be integrated with our CCTV surveillance offering for combined entry logging and video verification at secured entrances.
