

Data Center Co-location Services Brochure

Category: DataCenter

Our data center offers quarter-rack, half-rack, and full-rack co-location options, with custom cage configurations available for enterprise clients requiring dedicated physical security zones.

All co-located infrastructure is backed by a 99.9% uptime service level agreement, with service credits automatically calculated and applied for any downtime beyond the agreed threshold in a given billing cycle.

Backup power runs on an N+1 redundant configuration combining UPS battery systems with diesel generator failover, tested monthly as part of standard data center operations.

For clients relocating existing infrastructure, we provide full-service data center migration including planning, physical relocation, and post-migration validation testing to confirm all systems are operating correctly at the new location.
