

Electrical & Solar Installation Guide

Category: Electrical

Our electrical installation division handles wiring, panel upgrades, and safety certification for commercial and residential clients, often bundled with our solar installation services.

A standard electrical installation for a small commercial unit takes approximately 5 to 7 business days from the initial technician site visit through final safety testing and certification of the completed panel work.

When electrical and solar installation are bundled together, the combined project timeline typically extends to 10 to 14 business days end-to-end, covering wiring, panel setup, solar mounting, inverter installation, and final grid connection approval.

Every completed electrical installation includes a mandatory safety inspection certificate issued by our certifying technician after final testing, which clients will need for regulatory compliance and insurance purposes.

Residential solar-only installations, when not bundled with broader electrical work, typically take 4 to 6 business days including mounting, wiring, and grid connection approval from the local utility provider.
