

FTTH (Fiber-to-the-Home) Installation Guide

Category: FTTH

Fiber-to-the-Home (FTTH) installation brings dedicated fiber-optic connectivity directly to residential and commercial premises, supporting symmetric internet plans from 100 Mbps up to 1 Gbps.

A standard residential FTTH installation takes 3 to 5 business days from the initial site survey through to final activation, assuming no permitting or right-of-way delays are encountered during the trenching phase.

Before installation begins, our technician will require proof of premises ownership or a valid tenancy agreement, a signed service contract, and local right-of-way clearance documentation if underground trenching is required for the fiber run.

Installation in multi-unit apartment buildings follows a similar process but may extend the overall timeline to 7 to 10 business days, depending on how quickly building management approves shared-conduit access for the installation crew.

Once activated, our support desk can assist with router configuration and initial speed testing to confirm the installed plan is performing as expected.
