

Smart City Pilot Program Case Study

Category: SmartCity

Our Smart City division has delivered pilot programs combining smart lighting, traffic sensor deployment, and centralized monitoring dashboards for municipal zones seeking to modernize public infrastructure.

A typical Smart City pilot includes deployment of smart streetlights with adaptive brightness control, IoT-based traffic flow sensors at key intersections, and a centralized dashboard for real-time monitoring by city staff.

Pilot programs typically run for 6 to 12 months, followed by a formal review period during which outcome metrics are evaluated before any decision is made regarding city-wide expansion of the piloted technologies.

Structured cabling for Smart City control cabinets is certified against TIA/EIA standards, with full test reports provided to the municipal client upon project completion.
